

MY SLOT NOTES

RESULT = Robert E Sult

For the best reSULT conSULT SULT

Bally A

Printer Bezel lights

Had two – so far (Blacked out)

Notice – this board only has a resistor and 6 LED's –

Since the diodes are daisy chain – it only takes one to go bad to turn off the display

The first one I had D1 was bad – the one here D2 was bad.

A temporary fix was to remove the bad LED and just jumper it. I had no problems to the slight change in voltage – current on the other LED's (but I would NOT jumper more than one) as I said it was only a temporary fix. LED's are now on order.
