## IGT PE+ Video Game resetting

When an IGT VIDEO GAME,

- 1) Monitor turns off and on during a game
- 2) Monitor turns off and on when you press a button
- 3) Monitor turns off and on when you open the Door.

*The problem may seem to be in the Monitor - But their may be something else going on. It may not be the Monitor turning off and on. It may be the Game is resetting.*

*Replace the Board, send the board to the bench Tech*

with any and all information.

Some of the IGT games may be old, and in time the components will brake down and will not work on lower voltage, In most Casino - I think you would be lucky to have 110 volts going to each game. But I have even seen boards that would reset with 110 volts being supplied.

*There is Caps & maybe some Diodes that may need to be replaced.*

*Mostly Caps. and the board will be just like new and will work on lower voltage.*
